Team,

We are encountering a system behavior where updating an RMA specifically within the *Quality Issue Details, Root Cause, and Corrective Action* fields results in the removal of key asset attributes, including:

- Review Status
- Functional Rating
- Cosmetic Rating

Impact:

When these fields are cleared via the review of the *Warranty Claim Status, Warranty Claim Action and Warranty Claim Action Approval*, the asset is no longer recognized as *Available for Sale* from our DI sales team members, which creates downstream rework and requires Sales to manually validate assets before adding them to an opportunity and creating extra touch points for administrators.

Required Action:

If you are updating an RMA requiring any update to *Warranty Claim Status, Warranty Claim Action and Warranty Claim Action Approval*, you must ensure that upon completion:

- The Asset record is reviewed and accurate
- All required statuses and ratings are restored to align with previously set dispositions

Failure to complete this step will result in the asset being immediately unavailable for sale and additional downstream validation work.

Additionally, I have created a Salesforce case (9998) to evaluate this workflow and attempt to alleviate any future re-work with actions involving our RMA's.

If you would like to set aside time to discuss this, I will setup a meeting for those discussions.

Best regards,

Blake Nielsen
