

ARCHITECT REVIEW

SALDEV-1440 | Distinguish Stepped-Up and Standard Quote Groups

Flywire Partial | Architect verification and check-only readiness assessment

Source	FlywirePartial Org 00DhG0000000jOXUAY
Local source	DX source synchronized from FlywirePartial
Review date	26 August 2026
Check-only	Succeeded Job 0AfhG000001XgKrSAK 1/1 validated
Decision	GO - Close in Partial; validate separately before promotion
Boundary	Read-only retrieval and check-only validation; no deployment or activation

ARCHITECT DECISION

Approve SALDEV-1440 for closure in Partial. The checkbox, Line Editor visibility, and sales permissions are present, and the scoped field-set dry run passed unchanged. Keep SALDEV-1404 testing and cloning observations as linked follow-up scope.

Acceptance outcome

#	Scope	Result	Evidence
1	Backend indicator	Pass	Allow Product Ramping exists on SBQQ__QuoteLineGroup__c as a checkbox with default false.
2	QLE visibility	Pass	SBQQ__LineEditor displays the checkbox with effective start, subscription term, and effective end.
3	Sales access	Pass	CPQ Sales Permissions grants readable=true and editable=true for the indicator.
4	Ramped cloning	Pass	Partial review confirmed cloning saves once the groups cover the full contract timeframe.
5	Standard grouping	Pass	Different products and the same product with different Ship To locations were confirmed.
6	Scope separation	Scoped pass	SALDEV-1404 owns deeper duplicate testing; fee carry-over and later-group roll-down are separate observations.

Deployment readiness path

The live Partial configuration and local story source now align. The scoped dry run passed unchanged; promotion to another org still requires its own package and validation.

Figure 1. SALDEV-1440 Partial verification path

DESIGN READING

Green is verified in Partial. Blue is synchronized source. Amber remains linked follow-up scope.

Detailed dry-run findings

1. Check-only deployment evidence

Metric	Result	Evidence
Job	0AfhG000001XgKrSAK	checkOnly=true; rollbackOnError=true; NoTestRun
Payload	1 component / 3 files	FieldSet: SBQQ__QuoteLineGroup__c.SBQQ__LineEditor
Validated	1	The field set validated successfully and was reported unchanged against FlywirePartial.
Failed	0	No component failures or warnings were returned.
Tests	0	Metadata-only dry run; no Apex or record writes were in scope.

2. Exact configuration evidence

Configuration	Result	Live evidence
Backend indicator	Verified	Allow Product Ramping is a checkbox, defaults false, and identifies stepped-up groups.
Line Editor field set	Verified	Displayed fields include the indicator, effective dates, and subscription term.
Sales permission	Verified	CPQ Sales Permissions grants both read and edit access to the indicator.

3. Scope boundaries and follow-ups

Area	Status	Evidence / action
Current Partial org	Ready	Field, field-set placement, and permission access are present in the live sandbox.
Local source sync	Completed	The missing SBQQ__LineEditor metadata was added locally and exactly matches the live retrieval.
Duplicate matrix	Linked	SALDEV-1404 owns detailed New Business, Amendment, and Renewal duplicate validation.
Clone observations	Separate	One-time fee carry-over and no automatic later-group product roll-down should be tracked separately.
Promotion target	Not assessed	No destination org was supplied; repeat the scoped retrieve and check-only validation before promotion.

Quote group classification architecture

The user-visible checkbox selects the group use case while the shared field set and permission set expose the control consistently in the Quote Line Editor.

SALDEV-1440 | Quote group classification model

One visible indicator selects ramped or standard group behavior

Figure 2. SALDEV-1440 quote group classification and control model

Architect interpretation: the classification control is fully exposed in Partial. Ramped and standard paths share the same QLE and permission foundation, while deeper duplicate behavior remains linked to SALDEV-1404.

Required handoff gates

Gate	Required action	Owner	Evidence needed
1	Close SALDEV-1440 in Partial	Product owner	Attach the architect response and move the story from Unresolved after approval.
2	Maintain SALDEV-1404 linkage	QA / Developer	Complete the duplicate matrix for New Business, Amendment, and Renewal.
3	Log cloning observations	Product owner	Track one-time fee carry-over and later-group product roll-down outside this story.
4	Promote scoped metadata	Release manager	Include the checkbox field, Line Editor field set, and CPQ Sales Permissions only.
5	Validate destination org	Release manager	Require a clean three-component check-only result before deployment approval.
6	Execute business smoke test	Sales Ops / QA	Test ramped cloning, standard groups, and same-product groups with different Ship To values.

Ready-to-paste architect response

STORY COMMENT

Architect review completed for SALDEV-1440 in FlywirePartial. GO for closure in Partial: Allow Product Ramping exists, is visible in the Quote Line Editor, and is editable through CPQ Sales Permissions. The scoped field-set dry run succeeded unchanged (job 0AfhG000001XgKrSAK, 1 of 1 component, no deployment). Partial review evidence covers ramped cloning, standard groups, and same products with different Ship To locations. SALDEV-1404 remains responsible for the deeper duplicate matrix; one-time fee carry-over and later-group product roll-down should be tracked separately. Before promotion, deploy only the three story components, validate the destination org, and execute the business smoke tests.

Evidence boundary

This assessment combines the SALDEV-1440 ticket export, scoped live metadata retrieval, local source comparison, and a FlywirePartial check-only validation. No records, deployment, activation, quick deploy, or org metadata changes were performed.
