

ARCHITECT REVIEW

SALDEV-1467 | Resolve Apex Error on Opportunity Line ID Flow

FlywirePartial | Read-only implementation review and check-only validation

Source	FlywirePartial Sandbox org 00DhG0000000jOXUAY
Scope	1 obsolete Flow 3 triggers 6 Apex classes/tests
Review date	28 August 2026
Check-only	Failed Job 0AfhG000001ZTpISAG 10/10 components, 16/16 tests
Decision	NO-GO - Changes Requested before QA or promotion
Boundary	No records, deployment, activation, or org metadata were changed

ARCHITECT DECISION

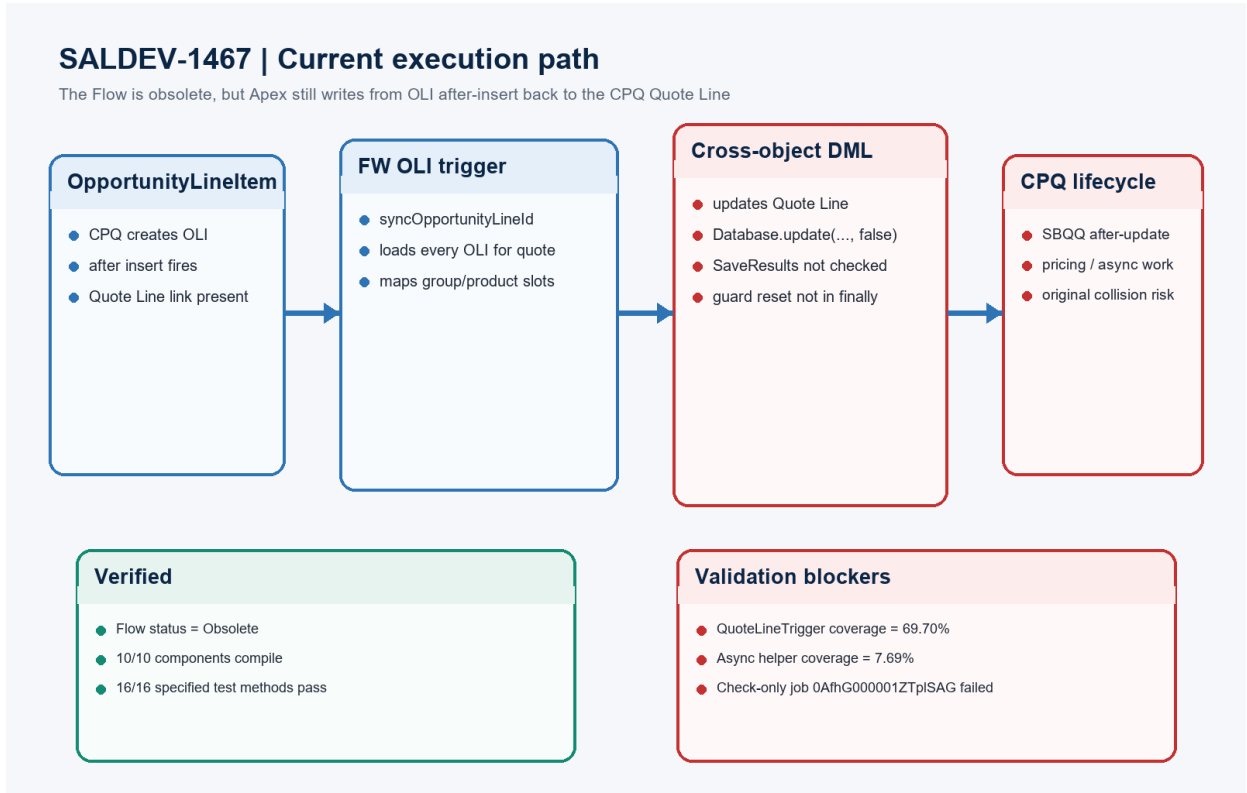

Do not approve SALDEV-1467. The scoped package compiles and all specified tests pass, but check-only validation fails coverage gates and the replacement retains the original cross-object Quote Line DML risk from an OLI after-insert context.

Acceptance outcome

#	Scope	Result	Evidence
1	Original Flow	Verified	copying_of_Opportunity_Line_Id_unique_identifier has status Obsolete in FlywirePartial.
2	Stepped products	Partial	Mapping logic exists, but tests prove only non-null/fallback values rather than exact cross-group identity for all bundle slots.
3	Price-change clone	Not proven	The amendment method is invoked, but no assertion confirms the cloned line retains the source Opportunity Line ID.
4	Other clone	Not proven	No test proves an ordinary clone receives a new Opportunity Line ID or remains independent of the source line.
5	New / Amend / Renew	Gap	Fixtures mention these contexts, but end-to-end cloning outcomes are not asserted for each lifecycle path.
6	Error-free quoting	Blocked	Synthetic tests pass; no representative bundle test proves the CPQ async collision is eliminated.

Runtime-risk path

The obsolete Flow removes one writer, but the replacement OLI after-insert trigger still performs cross-object DML on SBQQ__QuoteLine__c and can re-enter CPQ after-update processing.

Detailed review findings

1. Check-only validation evidence

Metric	Result	Evidence
Validation job	Failed	0AfhG000001ZTpiSAG; checkOnly=true; rollbackOnError=true; no component or test errors.
Payload	10 components	1 Flow, 3 triggers, 6 Apex classes/tests; all 10 compiled successfully.
Specified tests	16 passed	OpportunityLineItemTriggerHandlerTest (2), QuoteLineTriggerHandleTest (8), QuoteLineGroupTriggerTest (6).
Coverage gates	Failed	QuoteLineTrigger 69.70%; QuoteLineGroupAsyncHelper 7.69%; each selected component requires at least 75%.
Focused test run	Passed	Job 707hG00000LhjKT; 100% pass rate; org-wide coverage 30%.

2. Exact approval blockers

Blocker	Impact	Exact evidence
Deployment coverage	Hard fail	QuoteLineTrigger has 33 executable locations with 10 uncovered; helper has 13 with 12 uncovered.
Cross-object DML	Runtime risk	OLI after insert calls Database.update on Quote Lines, re-entering the managed SBQQ after-update lifecycle.
Silent failure handling	Data risk	Database.update(..., false) SaveResults are ignored; guard reset is not protected by finally.

3. Code and test-quality findings

Area	Status	Evidence / required action
Fallback overload	Defect	When relationship data is absent, processOlildSync(List) adds Quote Line IDs to the quote-ID set; its test asserts only true.
Ramp key design	Risk	Before-insert mapping keys only quote plus product and uses ordered slots; repeated products in multiple bundles can be ambiguous.
Exception handling	Risk	copyOpportunityLineIdOnRamp catches all exceptions and only debugs, allowing quoting to continue with missing IDs.
Acceptance assertions	Missing	No exact ID equality/inequality assertions for price-change clones, ordinary clones, and all New/Amend/Renew paths.
SALDEV-1427 overlap	Unscoped	The ticket says part of SALDEV-1427 is covered, but the promoted component/test boundary and ownership are not defined.

Safe replacement and proof model

The fix should establish identifiers before CPQ-managed after-update work, make mapping deterministic for duplicate bundle structures, surface partial DML failures, and test every lifecycle outcome explicitly.

SALDEV-1467 | Acceptance-evidence gap

Coverage is high on some classes, but assertions do not prove the required business outcomes

Figure 2. SALDEV-1467 acceptance-evidence gap and required scenario matrix

Architect interpretation: the implementation is not release-ready. Passing tests show executable code, but the failed coverage gate and unchanged cross-object DML pattern leave both deployment and runtime acceptance unresolved.

Required approval gates

Gate	Required action	Owner	Evidence needed
1	Remove re-entry risk	Developer / CPQ architect	Redesign the OLI-to-Quote-Line sync so the fix does not issue Quote Line DML from OLI after insert in the CPQ transaction.
2	Clear coverage gates	Developer	Raise QuoteLineTrigger and QuoteLineGroupAsyncHelper to at least 75% in the exact deployment payload.
3	Assert acceptance rules	Developer / QA	Add exact same-ID and new-ID assertions for stepped, price-change, and ordinary clones across New, Amend, and Renew.
4	Exercise CPQ scale	CPQ QA	Run representative large bundles and confirm no AsyncException, recursion, SOQL 101, or silent SaveResult failures.
5	Bound SALDEV-1427	Product owner / Architect	Document which ramp-ID behavior belongs to SALDEV-1467 versus SALDEV-1427 and deploy/test them as one controlled dependency set.
6	Revalidate and QA	Release manager / QA	Require a clean 10/10 check-only result, then execute named New/Amend/Renew scenarios with field-level evidence.

Ready-to-paste architect response

STORY COMMENT

Architect review completed for SALDEV-1467 in FlywirePartial. Changes Requested / NO-GO. The original Flow is Obsolete and the scoped Apex compiles, but check-only job 0AfhG000001ZTpISAG failed: all 10 components compiled and all 16 specified test methods passed, yet QuoteLineTrigger is only 69.70% covered and QuoteLineGroupAsyncHelper is 7.69%, below the 75% requirement. More importantly, FWOpportunityLineItemTrigger still runs after insert and OpportunityLineItemTriggerHandler performs Database.update on SBQQ__QuoteLine__c, so the replacement retains the same CPQ after-update re-entry pattern implicated in the original AsyncException. SaveResults are not inspected, one fallback path treats a Quote Line ID as a Quote ID, and the tests do not assert the required same-ID/new-ID outcomes across New, Amendment, and Renewal cloning. Redesign the cross-object sync, fix coverage, add exact lifecycle assertions, clarify the SALDEV-1427 dependency, and repeat check-only plus representative CPQ bundle QA before approval.

Evidence boundary

This assessment uses the SALDEV-1467 ticket text, read-only FlywirePartial identity verification, scoped metadata retrieval, focused Apex tests, source inspection, and a check-only validation. No records, deployment, activation, quick deploy, or org metadata changes were performed.
