Update ARR-related flows for stepped-up pricing

User Story: ARR calculations for stepped up pricing must be based on the average price/usage rate across the subscription term, and should be calculated according to existing logic.

Requirement Detail:

Review the results of the investigation on [SALDEV-1396](#) and make the necessary updates to the ARR-related flows. See documentation:

Design Detail:

See <https://docs.google.com/spreadsheets/d/1IZ6W0abAFUOVjV5VIsVwqLH1v1-wWXYBsl-VeRIXzj0/edit?usp=sharing>

Ada and Meg put this file together by reviewing the current ARR calculations documentation and identifying which calculations involve pricing-related fields. Those fields (Quoted Price or Usage Rate %/Amt) will be averaged across the stepped up pricing groups, so those calculations need to be modified to use the average value instead. The average price fields will be created on [SALDEV-1409](#)

Some of the ARR calculations take the Prorate Multiplier into account, so that must also be calculated for the entire term of each line. This calculation can be added to the apex created on [SALDEV-1409](#).

On each ARR calculation flow:

- At the beginning of the flow, loop through all products. For all identical lines (ie, cloned lines across stepped up pricing groups, OR individual lines for non-stepped up pricing, add up the Prorate Multiplier values for each identical line and store it, if Prorate Multiplier is part of the ARR formula calculation. (The average pricing fields have been created using apex on [SALDEV-1409](#))
- For lines that don't have stepped up pricing groups, they too can use the average pricing fields and the total Prorate Multiplier values calculated in the apex logic on [SALDEV-1409](#).
- The idea is to have the above logic at the start of the flow, so that we don't need to maintain separate formulas for stepped up pricing vs non-stepped up pricing. Stepped up pricing must use average pricing and total proration (since the prorate multiplier on the lines in the groups will be only for the term of the group, not the entire quote's subscription term). Non-stepped up pricing must continue to use the existing pricing fields and the prorate multiplier (which equals the quote's subscription term).
- Then calculate the ARR in the existing formulas, but use the pricing and prorate multiplier fields in the formulas with the average pricing and total proration.

Implementation Detail: 1. Below flows related to ARR calculation are updated for stepped up pricing. Details of update are added in attached sheet -> name - Quote Line fields used in OppLineItem flows: ARR -> column D:

https://docs.google.com/spreadsheets/d/1uwEDqSCzH1f1wLZckz_x6J1C5eu_sxNJiYjxpF_zUAW/edit?gid=146669303#gid=146669303

2. Apex QuoteLineTriggerHandler method calculateAveragePriceupdate to calculate Sum of field SBQQ__ProrateMultiplier__c per product and update it on field Total_Prorate_Multiplier__c (List of components for this point are same as [SALDEV-1409](#)).

List of components:

- (Opp Product) B2B Domestic ARR Calculator
- (Opp Product) B2B XB Utilization Calculation
- (Opp Product) Edu Domestic ARR Calculator
- (Opp Product) Edu Payables ARR Calculator
- (Opp Product) Edu StudyLink ARR Calculator
- (Opp Product) Fixed Price Products ARR calculation
- (Opp Product) Healthcare ARR
- (Opp Product) SFS ARR Calculator
- (Opp Product) Travel DOM ARR Calculator
- (Opp Product) Travel Payables ARR Calculator
- (Opp Product) US Loans ARR Calculator
- (Opp Product) Travel XB ARR Calculator

Acceptance Criteria:

Quotes with sfs, a fixed price product and payments products with Step up pricing groups calculate ARR using the Average price across the groups.

Quotes with sfs and payments products without Step up pricing groups calculate ARR and return value as expected with Avg price not impacting the result.

Reference ARR Calculation sheet for ARR fields to fill out and expected results.

[Brette Chmura](#) This is the ticket that will be managing the ARR updates. Once built we will have you test. Please take a look at the Attached sheet showing which products will be impacted by having multi year/ groups on the quote.

Hi [Ada Cirillo](#) [Meg Vogler](#) - Right now average is calculated for quote line fields NS_Usage_Rate_c and Quoted_Price_c.

NS_Usage_Rate_c is formula field and quote line fields Adjusted_Rate_Percentc, Adjusted_Rate_Amountc, Usage_rate_c, usage_rate_AMtc are used in formula.

Above fields are also used in formula fields Quoted_Usage_Percent_c and Quoted_Usage_Amt_c.

These fields are used on ARR calculation. Could you please confirm if we need to calculate average of quote line fields Quoted_Usage_Percent_c and Quoted_Usage_Amt_c?

[Parth Tare](#) - as we discussed today on the call with [David Okolo](#), let's leave the Quoted Usage Percent and Quoted Usage Amt fields in flows as they currently are. One key reason is that the flows would still have to divide by 100 where there are percent usage rates, so we may as well use the existing logic instead.

Hi [Varini Rajkumar](#) - Changes for B2B and Education (except SFS) flows are completed. Assigning you for testing. Thanks

Below flows related to ARR calculation are updated for stepped up pricing.

1. [\(Opp Product\) B2B Domestic ARR Calculator](#)
2. [\(Opp Product\) B2B XB Utilization Calculation](#)
3. [\(Opp Product\) Edu Domestic ARR Calculator](#)
4. [\(Opp Product\) Edu Payables ARR Calculator](#)
5. [\(Opp Product\) Edu StudyLink ARR Calculator](#)

6. [\(Opp Product\) Fixed Price Products ARR calculation](#)
7. [\(Opp Product\) Healthcare ARR](#)
8. [\(Opp Product\) SFS ARR Calculator](#)
1. [\(Opp Product\) Travel DOM ARR Calculator](#)
2. [\(Opp Product\) Travel Payables ARR Calculator](#)
3. [\(Opp Product\) US Loans ARR Calculator](#)
4. [\(Opp Product\) Travel XB ARR Calculator](#)
