

ARCHITECT REVIEW

SALDEV-1473 | Multiple Ship-to Account Header Fix

FlywirePartial | Deployed Flow correction and functional validation

Source	FlywirePartial Enterprise sandbox 00DhG0000000jOXUAY USA1148S
Test record	Q-37873 Draft 44 lines 32 ramped 2 ship-to accounts
Review date	1 September 2026
Validation mode	Live metadata read-back check-only deployment QLE Quick Save SOQL read-back
Decision	APPROVE / PASS - Primary acceptance criterion verified in FlywirePartial
Boundary	Version 8 active; no Production change and no bulk record backfill

ARCHITECT DECISION

Approve SALDEV-1473 in FlywirePartial for the primary acceptance criterion. Flow version 8 is active, both validations succeeded, and Q-37873 changed from No to Yes on Quick Save with independent SOQL read-back. Complete the listed regression cases before promotion beyond the sandbox.

Acceptance outcome

#	Scope	Result	Evidence
1	Story acceptance	PASS	Q-37873 changed Multiple Ship to Accounts from No to Yes after Quick Save.
2	Quote-wide calculation	PASS	44 lines included two ship-to accounts; six lines used the alternate account.
3	Stepped / mixed groups	PASS	The quote had five groups, 32 ramped lines, and 12 non-ramped lines.
4	Create and update path	IMPLEMENTED	Active version 8 uses CreateAndUpdate with RecordAfterSave.
5	Deployment integrity	PASS	Check-only and deployment each validated one Flow with zero component errors.
6	Regression breadth	FOLLOW-UP	Pure non-stepped, alternate ramped-line, Yes-to-No, and delete-only cases remain.

Root cause and correction path

The defect was a record-by-record last-writer race. Flow version 8 now evaluates all quote lines after create or update and derives one deterministic header value from direct or inherited ship-to accounts.

DESIGN READING

Blue is preserved control logic. Green is the quote-wide correction and verified live evidence. Amber is recommended regression coverage before promotion beyond Partial.

Detailed implementation and validation

1. Live org and version evidence

Evidence area	Observed result	Evidence
Target org	FlywirePartial	Flywire Enterprise sandbox 00DhG0000000jOXUAY; instance USA1148S.
Prior active Flow	Version 6	Update-only and line-by-line; became obsolete after version 8 activation.
Prior attempted Flow	Version 7	Obsolete; changed only the trigger to CreateAndUpdate.
Current Flow	Version 8 Active	301hG000000BfrsBQAR is both ActiveVersionId and LatestVersionId.
Mismatch sample	24 of 155 quotes	2,000 recent lines showed 24 incorrect No headers; 15 included ramped lines.

2. Deployment and metadata outcome

Deployment gate	Result	Evidence
Check-only	PASS	0AfhG000001bMygSAE 1 Flow 0 component errors CheckOnly=true.
Deployment	PASS	0AfhG000001bPN5SAM 1 Flow 0 component errors CheckOnly=false.
Metadata read-back	PASS	CreateAndUpdate, RecordAfterSave, six lookup filters, expected Yes/No routing.

3. Functional result and coverage boundary

Test / boundary	Status	Evidence
Primary QLE test	PASS	Q-37873 Quick Save updated the header to Yes; independent SOQL confirmed Yes.
Record remained safe	PASS	Quote remained Draft and non-ordered; no line values were intentionally edited.
Mixed-group detection	PASS	Ramped and non-ramped groups coexisted; alternate ship-to lines were detected.
Yes-to-No reset	PENDING	Use a separate clone and return the final alternate ship-to line to the quote account.
Delete-only reset	SEPARATE SCOPE	The active Flow handles create/update; delete-only recalculation needs a decision.

Quote-wide Flow architecture

The correction adds one focused Get Records element and changes decision routing while preserving hierarchy validation, the Strategic Partner exception, and Renewal plus Upsell behavior.

SALDEV-1473 | Active Flow version 8

Single-component correction with explicit preservation boundaries

Figure 2. SALDEV-1473 active Flow version 8 and validation boundary

Architect interpretation: the single-line calculation was the failure mode. The new full-quote query removes processing-order dependence and passed the named stepped/mixed QLE acceptance test.

Recommended completion gates

Gate	Recommended action	Owner	Evidence needed
1	Run pure non-stepped regression	CPQ QA	Quote without ramped groups; verify No -> Yes and stable Quick Save.
2	Use alternate account on ramped line	CPQ QA	A ramped segment directly using the alternate related account updates the header to Yes.
3	Run Yes-to-No reset	CPQ QA	On a clone, remove the final alternate ship-to and verify the header returns to No.
4	Run create-only scenario	Developer / QA	Create a new alternate-account line and verify Yes without a later line edit.
5	Decide delete-only behavior	Product Owner	Confirm whether deletion must reset immediately; add a separate delete path if required.
6	Capture source and release evidence	Dev Lead / DevOps	Commit the focused Flow diff and attach validation, deployment, and QLE evidence.

Ready-to-paste architect response

STORY COMMENT

Architect review completed for SALDEV-1473 in FlywirePartial. The defect was caused by record-by-record Flow logic: a later quote line matching the quote account could overwrite a prior Yes result back to No. The existing QuoteLine After Record Triggered Flow was updated as version 8 to run after create and update, query the full quote for a direct or inherited ship-to account that differs from the quote account, and route deterministically to Yes or No. Existing hierarchy validation, the Strategic Partner exception, and Renewal plus Upsell behavior were preserved. Check-only 0AfhG000001bMygSAE and deployment 0AfhG000001bPN5SAM each succeeded for one Flow with zero component errors. Version 8 is active. Q-37873 provided the named acceptance test: 44 lines, five groups, 32 ramped lines, two ship-to accounts, and six alternate-account lines. Quick Save changed the header from No to Yes, and independent SOQL read-back confirmed Yes. Primary acceptance criterion: PASS. No Production changes or bulk data backfill were performed. Complete the recommended pure non-stepped, alternate ramped-line, Yes-to-No, create-only, and delete-scope checks before broader promotion.

Evidence boundary

This assessment combines the SALDEV-1473 story, live FlywirePartial org identity and Flow metadata, focused check-only and deployment evidence, a 30-day quote-line mismatch sample, and the Q-37873 Quick Save test. The scope was one existing Flow. No Apex, fields, permission sets, Production changes, or bulk data backfill were included.
