

SALDEV-1473 - Implementation and Test Notes

Org: FlywirePartial sandbox

Flow: QuoteLine After Record Triggered Flow

Test quote: Q-37873

Date verified: 1 September 2026

1. Story requirement

The Multiple Ship to Accounts field on the Quote must be set to Yes when quote lines use more than one related Ship-To Account. The behavior must work for stepped-pricing quotes, non-stepped quotes, and quotes containing groups that are not used for stepped pricing. The field is expected to update after Save or Quick Save in the Quote Line Editor.

2. What we found

- The issue was in the existing QuoteLine After Record Triggered Flow.
- The previous logic evaluated the quote line being processed instead of calculating the result from the complete set of lines on the quote.
- This created a last-writer problem. A line using a different Ship-To Account could set the Quote field to Yes, but a later line matching the Quote Account could set it back to No.
- The failure was easier to see on stepped-pricing quotes because Quick Save processes many ramped and grouped lines in one transaction.
- The correct decision must be quote-wide and must not depend on quote-line processing order.

3. What we changed in the Flow

A new version of the existing Flow was created and activated. The active version is version 8.

- Changed the record-trigger behavior so the Flow runs after create and update.
- Added the Get Records element Get Quote Line With Different Ship To.
- The lookup searches the full quote, not only the current quote line.
- The lookup checks for a quote line with a direct Ship-To Account that is different from the Quote Account.
- The lookup also supports the inherited Parent Ship-To Account path used by the existing account-hierarchy logic.
- When a different related Ship-To Account is found, the Flow routes to the existing Yes update path.
- When no different Ship-To Account is found, the Flow routes to the existing No update path.
- Existing hierarchy validation was preserved.
- The existing Strategic Partner exception was preserved.
- The existing Renewal plus Upsell behavior was preserved.
- No Apex class, field, permission set, Production configuration, or bulk data update was included.

4. Flow logic after the change

1. A Quote Line is created or updated and the after-save Flow starts.
2. The Flow keeps the existing validation and exception checks.
3. The Flow queries all relevant Quote Lines for the same Quote.
4. The query looks for at least one direct or inherited Ship-To Account that differs from the Quote Account.
5. If a matching line is found, the Quote Multiple Ship to Accounts field is updated to Yes.
6. If no matching line is found, the Quote Multiple Ship to Accounts field is updated to No.

7. Because the decision is based on the complete quote, later quote-line processing cannot overwrite the correct result based only on one line.

5. Technical and deployment facts

- Target org: FlywirePartial, Flywire Enterprise sandbox.
- Organization ID: 00DhG0000000jOXUAY.
- Instance: USA1148S.
- Active Flow version: 8.
- Active version ID: 301hG00000BfrsBQAR.
- Flow trigger: CreateAndUpdate, RecordAfterSave.
- Previous active version 6 is obsolete. Version 7 is also obsolete.
- Check-only job 0AfhG000001bMygSAE completed for one Flow with zero component errors.
- Deployment job 0AfhG000001bPN5SAM completed for one Flow with zero component errors.
- Read-only sampling of 2,000 recent quote lines covered 155 quotes. Twenty-four quotes showed an incorrect No value, and 15 of those quotes included ramped lines.

6. Functional test completed

- Selected record: Q-37873.
- The Quote was Draft and not ordered.
- The Quote had 44 lines in five groups.
- Thirty-two lines were ramped and 12 were non-ramped.
- The lines used two Ship-To Accounts. Six lines used the alternate account.
- Before Quick Save, Multiple Ship to Accounts was No.
- The Quote Line Editor was opened, the line/account setup was confirmed, and Quick Save was selected without intentionally changing line values.
- After Quick Save, Multiple Ship to Accounts changed to Yes.
- An independent Salesforce query confirmed the stored Quote value was Yes.
- The primary acceptance criterion passed in FlywirePartial.

7. Steps to reproduce and verify in FlywirePartial

Use an editable test quote or a clone. Do not reuse a shared business-testing record for repeat testing.

1. Open the FlywirePartial sandbox.
2. Open a stepped-pricing test Quote that has a primary Account and access to a second related Ship-To Account in the same hierarchy. Q-37873 was the selected record used for this verification.
3. On the Quote detail page, record the Quote number, Account, Multiple Ship to Accounts value, Quote type, and status.
4. Confirm the Quote is editable and open Edit Lines.
5. Confirm the Quote contains ramped or stepped groups and that at least one line uses the alternate related Ship-To Account while other lines use the Quote Account.
6. For Q-37873, confirm 44 total lines, five groups, 32 ramped lines, two Ship-To Accounts, and six alternate-account lines.
7. Select Quick Save. Do not intentionally change pricing or other quote-line values when only verifying the Flow behavior.
8. Return to or refresh the Quote detail page.
9. Confirm Multiple Ship to Accounts is Yes.
10. Run an independent read-only query or record refresh to confirm the stored Quote value is Yes.

11. Record the result and the test Quote used. For any additional negative or reset testing, use a separate clone.

8. AutoFAST / automated regression scenarios

No AutoFAST execution result was included in the story evidence or the completed sandbox validation. The following cases should be added to or run through the automated regression suite before broader promotion:

- Stepped-pricing Quote: a different Ship-To Account exists and the header changes from No to Yes after save.
- Non-stepped Quote: a different Ship-To Account exists and the header changes from No to Yes.
- Mixed Quote groups: ramped and non-ramped groups exist and the header is calculated correctly.
- Inherited Parent Ship-To Account: the hierarchy path identifies the different account and sets Yes.
- Yes-to-No reset: the final alternate Ship-To Account is removed or changed back and the header returns to No.
- Create-only scenario: a new alternate-account line causes the header to become Yes without requiring a later edit.
- Strategic Partner and Renewal plus Upsell scenarios continue to follow their existing exception paths.
- Delete-only behavior must be confirmed with the Product Owner because the active Flow currently handles create and update, not deletion.

9. Our analysis and conclusion

The root cause was processing-order dependence in record-by-record Flow logic. The correction is appropriate because the Quote header is now derived from the complete Quote Line state. The deployed Flow version passed the named stepped and mixed-group Quick Save test on Q-37873, and the saved Quote value was independently confirmed. The primary story acceptance criterion is therefore passed in FlywirePartial. The additional automated and manual regression cases above should be completed before promotion beyond the sandbox.

10. Ready-to-paste story update

SALDEV-1473 was fixed in FlywirePartial by updating QuoteLine After Record Triggered Flow. The previous record-by-record logic could set Multiple Ship to Accounts to Yes and then overwrite it back to No when a later line used the Quote Account. Active Flow version 8 now runs after create and update, queries the complete Quote for a direct or inherited Ship-To Account that differs from the Quote Account, and then updates the header deterministically to Yes or No. Existing hierarchy validation, the Strategic Partner exception, and Renewal plus Upsell behavior were preserved. Check-only job 0AfHG000001bMygSAE and deployment job 0AfHG000001bPN5SAM each completed for one Flow with zero component errors. Q-37873 was verified in the Quote Line Editor: 44 lines, five groups, 32 ramped lines, two Ship-To Accounts, and six alternate-account lines. Quick Save changed the header from No to Yes, and an independent query confirmed Yes. The primary acceptance criterion passed. AutoFAST or equivalent regression coverage is still required for non-stepped, Yes-to-No, create-only, inherited-account, and delete-scope scenarios before broader promotion. No Production changes or bulk data backfill were performed.
