

PR REVIEW

SCC-4486 | Skip Book Appointment & Drop Tasks

Great Plains | OmniStudio orchestration peer review

Review type	PR / peer review only - no IT or UAT execution
Scope	5 OrchestrationItemDefinition DataPacks 9 named files
Source evidence	GreatPlainsMerge read-only SOQL Vlocity CMT 900.650.3.1
Decision	Changes Requested - PR diff and condition evidence required
Boundary	No PR approval/comment, deployment, activation, record write, or org metadata change

PR DECISION

Changes Requested. The nine PR files and diff are unavailable, and the story does not define the authoritative MDU Tenant discriminator. Do not approve until the additive condition logic and dependency preservation are visible in the PR.

Acceptance and PR outcome

#	Review scope	Result	Evidence
1	Five named items	Partial	All five exist as ManualTask definitions in the Internet Plan; the PR payload itself was not available.
2	MDU Tenant signal	Fail	Order has nullable MDU identifier fields, but the story and available evidence do not identify which field/value proves tenant status.
3	Automatic Skipped state	Design fit	Salesforce skips an item when its execution condition evaluates false; the PR must therefore exclude MDU Tenants, not positively select them.
4	Existing behavior	Unverified	Current conditions contain appointment, fiber method, facility type, and product gates. The PR must add to them rather than replace them.
5	Downstream continuation	Unverified	Skip Branch is currently false, but ParentKeys and dependency payload changes cannot be reviewed without the PR files.

Condition and dependency design

The safe implementation preserves every existing execution condition and adds one explicit non-MDU gate. A false result for an MDU Tenant produces the required Skipped state while downstream work continues only if Skip Branch remains false.

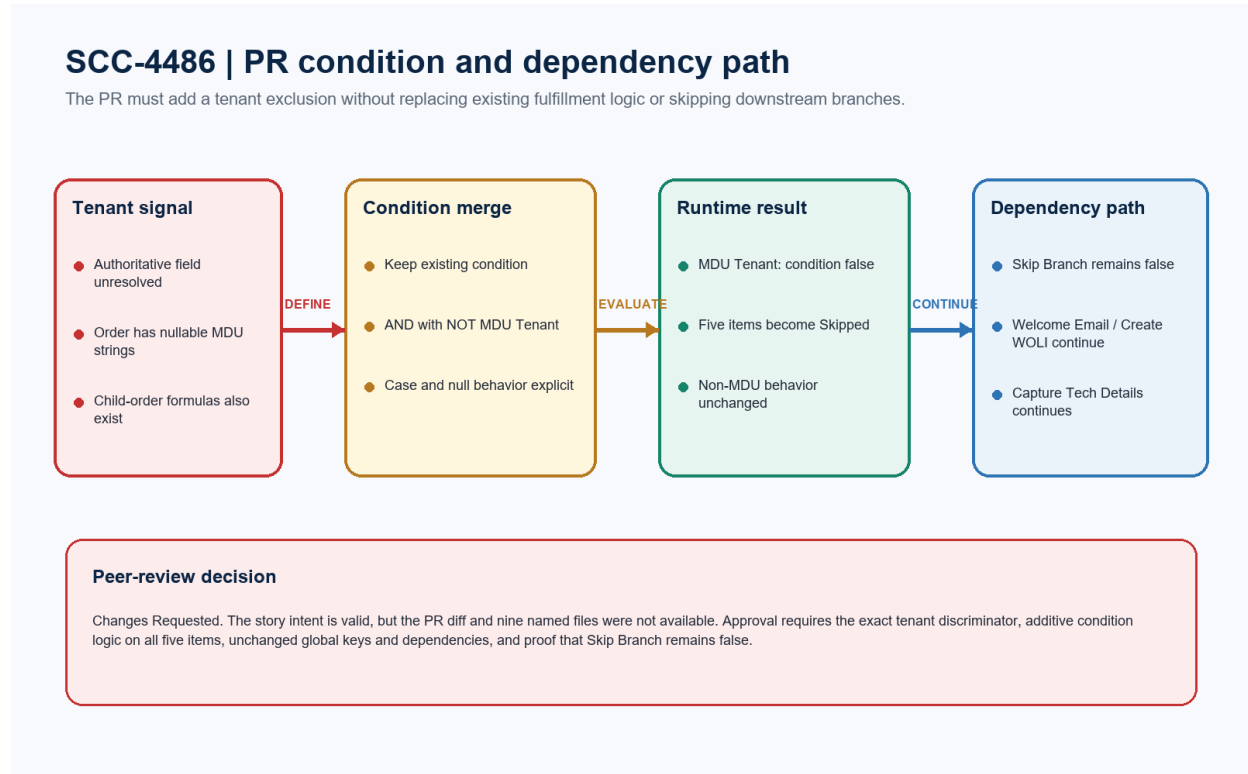

Figure 1. SCC-4486 PR condition and dependency path

LOGIC REQUIREMENT

Required pattern: ExistingCondition AND NOT(IsMDUTenant). Do not replace the existing condition, invert the result, or enable Skip Branch.

PR findings and required modifications

Severity	Finding	Required PR change / evidence
High	PR diff unavailable	Provide the PR URL/diff and all five DataPack.json plus four ParentKeys.json files. Approval cannot be evidence-based without them.
High	Tenant discriminator unresolved	Name the authoritative field, order context, exact value/null rule, and case handling. The available Order MDU fields are nullable strings, not an explicit Tenant flag.
High	Condition direction	The tenant clause must make the whole execution condition false for MDU Tenant orders. A positive MDU match would execute the task instead of skipping it.
High	Existing-condition preservation	Nest the current task condition with the tenant exclusion. Do not remove appointment status, installation method, facility type, or product-code logic.
Medium	Parent/child order context	Confirm whether orchestration reads Order.MDU_Identifier_* or the parent-order formula fields; use the field populated in the runtime order context.
Medium	Multi-item semantics	Confirm mixed-order behavior because an orchestration condition can be met when any associated order item meets it.
Medium	Case, null, and missing data	Define behavior for blank MDU identifiers and exact case-sensitive values so ordinary orders are not skipped accidentally.
Medium	Dependency blast radius	Keep IsSkipBranch false and preserve global keys. Book Appointment gates Triage, Welcome Email, and Create WOLI; Splice gates Capture Tech Details.
Medium	Product path inconsistency	Install Drop currently uses Product2.ProductCode while the other drop items use vlocity_cmt__Product2Id__r.ProductCode. Do not normalize this accidentally; confirm the correct runtime node.

REVIEW BLOCKER

The live source snapshot supports design review only. It is not a substitute for the PR diff and must not be used to approve the changed JSON payload.

Five-file condition scope

DataPack	Current source condition	Required PR treatment
Book Appointment	Order.Service_Appointment_Status__c != Scheduled	Add non-MDU gate; retain appointment status logic; keep Skip Branch false.
Triage, Prep-Work & Sitewalk	Installation method + facility type + product	Add the same tenant exclusion without changing dependency or product path.
Notify 811	Installation method + facility type + product	Add the same tenant exclusion; preserve dependency from Triage and to Install Drop.
Install Drop	Installation method + facility type + Product2.ProductCode	Add the same tenant exclusion; confirm Product2 path before any cleanup.
Splice and Cutover Drop	Installation method + facility type + product	Add the same tenant exclusion; preserve dependency from Install Drop and to Capture Tech Details.

DataPack and ParentKeys controls

Control	Peer-review expectation
DataPack identity	Preserve all five GlobalKey values, plan reference to Internet Plan, ManualTask record type, names, scope, and implementation references.
ConditionData	Change only the intended boolean tree; use valid nested AND/OR/NOT structure and preserve datatype, field-node, operator, and value tokens.
ParentKeys	Review all four modified ParentKeys files for stable existing keys only. Explain why Book Appointment has no ParentKeys file in the stated scope.
Unrelated drift	Reject regenerated IDs, reordered unrelated JSON, environment-specific record IDs, activation changes, or modifications outside the nine named files.
PR evidence	Include a readable before/after condition for each item and a file list proving the PR is limited to SCC-4486.

PR-ONLY BOUNDARY

No IT test, UAT execution, deployment validation, or runtime order result is claimed in this review. Those are separate release gates after the PR is technically approvable.

PR approval gates

#	Required action	Owner	PR evidence needed
1	Attach exact PR evidence	Developer	PR URL, base/head refs, commit SHA, nine changed files, and per-file patch.
2	Resolve MDU Tenant identity	Developer / Product Owner	Authoritative field and runtime order context; exact value, case, null, and mixed-order behavior.
3	Prove additive logic	Developer	Before/after ConditionData for all five items showing ExistingCondition AND NOT(IsMDUTenant).
4	Prove dependency preservation	Developer / Reviewer	Unchanged GlobalKeys, IsSkipBranch=false, stable ParentKeys, and no downstream branch removal.
5	Remove unrelated drift	Developer	PR contains only SCC-4486 DataPack/ParentKeys changes and no regenerated IDs or environment-specific values.
6	Re-review	Peer Reviewer	All high findings resolved in the actual patch; then approve PR or request remaining changes.

Ready-to-paste PR review response

PR COMMENT

PR review completed for SCC-4486. Changes Requested. The story targets five Internet Plan manual tasks: Book Appointment; Triage, Prep-Work & Sitewalk; Notify 811; Install Drop; and Splice and Cutover Drop. The PR URL/diff and nine named files were not available, so the changed ConditionData and ParentKeys cannot be approved. Before re-review, identify the authoritative MDU Tenant field and runtime order context, add the tenant exclusion as ExistingCondition AND NOT(IsMDUTenant) on all five items, preserve each existing appointment/drop condition, keep IsSkipBranch=false, retain all GlobalKeys and dependency keys, and remove unrelated or environment-specific JSON drift. Also confirm blank, case-sensitive, parent/child-order, mixed-order-item, and Product2 path behavior. This is PR review only: no IT test, UAT execution, deployment, activation, record write, or org metadata change was performed.
