

ARCHITECT REVIEW

SCC-3387 | Create Outage Ticket

Great Plains Merge Sandbox | Read-only dry-run and readiness assessment

Environment	GreatPlainsMerge (Sandbox) Org 00DEa00000GkAsHMAV
Review date	26 August 2026
Retrieval	Succeeded Job 09SEa00000iccfmMAA
Decision	Changes Requested - not ready for promotion
Boundary	No records, deployment, activation, or org metadata were changed

ARCHITECT DECISION

Do not promote yet. The Incident-based Outage path exists, but required data enforcement, severity values, NOC persona access, and queue membership are incomplete.

Acceptance outcome

#	Scope	Result	Evidence
1	Incident and Outage type	Partial pass	Incident is available and Outage is active. It is visible/default only for System Administrator; the business NOC persona is not identified.
2	Required outage fields	Fail	Five custom fields plus Detected Date Time exist, but all six are optional in schema, layout, and Dynamic Forms.
3	Severity and narrative	Fail	Description and Created Date exist; Impact is required but still High/Medium/Low, not Minor/Major/Critical.
4	NOC assignment	Partial pass	Active/latest before-save flow assigns new Outages to NOC. One existing Outage is NOC-owned, but the queue has zero direct members.
5	NOC access	Fail	No NOC profile/role user is identifiable. Only System Administrator has usable create access and Outage record-type visibility.

Solution and control path

The platform objects and automation are present, but the intended NOC user cannot be proven and the record can be saved without the story's required operational data.

Figure 1. SCC-3387 outage creation and ownership path

DESIGN READING

Green is configured. Amber is structurally present but operationally incomplete. Red blocks acceptance.

Field and page configuration

Field	Configured type	UI behavior	Acceptance reading
Affected Area/Region	Text(255)	Optional	Fail - required by story
Equipment/Facility ID	Text(255)	Optional	Fail - required by story
Estimated Customers Impacted	Number(18,0)	Optional	Type passes; requiredness fails
Detected Date Time	Date/Time	Optional	Fail - required by story
NOC Ticket Number Reference	Text(255)	Optional	Fail - required by story
Estimated Restoration Hours	Number(18,0)	Optional	Type passes; requiredness fails
Impact	Restricted picklist	Required	Fail - High/Medium/Low, not Minor/Major/Critical
Description	Text Area(32,000)	Optional	Present; can hold description/cause if product confirms
Created Date	System Date/Time	Read-only	Pass - platform timestamps creation

Requiredness evidence

Layer	Observed configuration
Schema	All five SCC-3387 custom fields have required=false; DetectedDateTime is nillable.
Page layout	Only Subject, Status, and Impact are marked Required. The six story fields use Edit.
Dynamic Forms	Only Subject, Status, and Impact use uiBehavior=required. The six story fields use uiBehavior=none.
Severity	Outage record type enables Impact values High, Medium, and Low. Low is the default.

DATA QUALITY BLOCKER

A user can save an Outage without the six operational fields named as required in SCC-3387. Enforce the requirement at the Dynamic Forms/page layer or with a record-type-scoped validation rule.

Persona, queue, and automation evidence

Access path	Count	Observed permission	Architect interpretation
System Administrator	41 active	Create/read/edit; Outage visible/default; fields editable	Technically works, but it is not a defined NOC least-privilege persona.
Standard User	0 active	No Incident object permission; Outage invisible; fields read-only	Cannot execute the story.
System Administrator - API Only	1 active	Incident create/edit; Outage invisible; fields editable	Integration persona, not a NOC business user.
SCC-3380 NOC permission set	0 assignments	No Incident object permission and none of the five SCC-3387 fields	Does not close the SCC-3387 access gap.

Automation and operational readiness

Area	Result	Evidence
Assignment flow	Pass	Assign_Outage_Incident_to_NOC is active/latest (version id 301Ea00001jiGEIIAM).
Trigger logic	Pass	Before-save on Incident create; checks Incident.Outage, looks up NOC queue, assigns OwnerId.
Existing evidence	Pass	One Outage exists and the aggregate ownership check shows it is NOC-owned.
Queue operations	Fail	NOC supports Incident and emails members, but it has zero direct members.
Runtime UAT	Not run	No test record was created or changed during this read-only review.

Component and evidence boundary

Boundary	Evidence
Focused retrieval	16 metadata files including the Incident object container; job 09SEa00000iccfmMAA succeeded.
Ticket omission	Queue:NOC and FlexiPage:Incident_Record_Page1 are required to reproduce the reviewed solution but are absent from the ticket component list.
Ticket extras	Case.SendEmail and Case_Before_Insert_Update_Trigger_Flow do not implement the stated outage-creation acceptance criteria.
Validation boundary	No check-only deployment was run because this review retrieved current sandbox configuration and introduced no change package.

Required approval gates

#	Required action	Owner	Evidence needed
1	Enforce required data	Admin / Product owner	Make the six story fields required for Incident.Outage and prove blank-save prevention.
2	Resolve severity design	Architect / Product owner	Use Minor/Major/Critical on Impact or approve a documented alternative; regression-check Incident logic.
3	Create NOC access model	Security owner	Grant named NOC reps least-privilege Incident create/read/edit, field edit, tab, and Outage record-type access.
4	Populate NOC queue	NOC manager / Admin	Add approved users or groups and verify notification, list-view visibility, and ownership work routing.
5	Correct component inventory	Release manager	Include Queue:NOC and Incident_Record_Page1; remove or justify unrelated Case components.
6	Run named-persona UAT	QA / NOC	Create an Outage from Incidents, complete all fields, save, verify NOC owner, and capture record ID/screenshots.

Ready-to-paste architect response

STORY COMMENT

Architect review completed in the GreatPlainsMerge sandbox. Changes Requested: the Incident Outage record type, Incident-enabled NOC queue, and Assign Outage Incident to NOC flow are present, and the flow is active/latest. However, all six operational fields named as required can still be left blank; Impact remains High/Medium/Low instead of Minor/Major/Critical; only the System Administrator profile has a usable create path to Outage; the NOC queue has zero direct members; and the existing NOC permission set has zero assignments and does not grant the SCC-3387 object/field access. The ticket package also omits Queue:NOC and Incident_Record_Page1 while listing unrelated Case components. Complete the six gates above and rerun the story with a named NOC user before promotion. No records, metadata, activation, deployment, or production changes were made.
