

PEER REVIEW

SCC 4273 Case Trouble Ticket Peer Review

Great Plains Merge Sandbox Read only implementation assessment

Environment	GreatPlainsMerge sandbox Great Plains Communications Org 00DEa00000GkAsHMAV
Review date	5 September 2026
Story / branch	SCC-4273 dev_SCC-4273__feat-Case_-_Trouble_Ticket_
Focused retrieval	Succeeded Jobs 09SEa00000jCU0XMAW, 09SEa00000jCVxUMAW, 09SEa00000jCxjyMAC
Decision	Changes Requested - do not approve the PR yet
Boundary	Read-only review; no records, metadata, activation, deployment, or access assignments changed

Decision Changes Requested. The Trouble Ticket record type, dedicated layout, source-listed fields, and reviewed profile access are present. Approval is blocked because the record type exposes only one Primary Resolution at runtime and the submitted PR URL, base, head, commit, and file diff were not supplied for code-parity review.

Acceptance outcome

#	Scope	Result	Evidence
1	Record type and layout	Pass	Trouble_Ticket is active. Case-Trouble Ticket contains the source-listed Case Information, Critical Dates, and Resolution Details fields.
2	Profile field access	Pass	Admin, Standard, and System Administrator - API Only have readable/editable access to all nine reviewed custom Case fields.
3	Subscriber Report values	Partial pass	All 64 unique supplied labels are enabled for Trouble Ticket. Eight additional enabled values require business confirmation.
4	Primary Resolution runtime	Fail	Only Cleared Without Repair is enabled for the Trouble Ticket record type, although 61 unique resolution labels were supplied.
5	Dependency design	Fail	Primary Resolution depends on Subscriber Report, but Subscriber Report has no Service Type controller. The intended matrix is not documented in acceptance criteria.
6	PR parity and API proof	Not proven	The document provides a branch name but no PR diff. The separate API org shown in screenshots was not connected for independent verification.

Layout and access evidence

Area	Result	Current Merge evidence
Case Information	Pass	Parent Case, Service Type, Service Address, standard Priority, Subscriber Report, and other routing/contact fields are present.
Critical Dates	Pass	Problem Occurred, Problem Reported, Repair, Created, and Closed dates are present.
Resolution Details	Pass	Primary Resolution, Secondary Resolution, and Resolution Detail are present.
Record type	Pass	Trouble_Ticket is active with ID 012Ea000007eNrVIAU.
Dedicated layout	Pass	Case-Trouble Ticket is assigned to the reviewed profiles for this record type.

Reviewed custom-field permissions

Profile metadata name	Read access	Edit access	Result
Admin	9 of 9 readable	9 of 9 editable	Pass
Standard	9 of 9 readable	9 of 9 editable	Pass
System Administrator - API Only	9 of 9 readable	9 of 9 editable	Pass

Problem Occurred Date, Problem Reported Date, Repair Date, Resolution Detail, Service Type, Service Address, Subscriber Report, Primary Resolution, and Secondary Resolution were reviewed. Standard Parent Case, Priority, Created Date, and Closed Date are governed through their standard-field and layout behavior rather than custom fieldPermissions entries.

Access traceability note

Evidence source	Peer review reading
Ticket comment	The branch was updated to include the fields in a permission set.
Observed Merge configuration	The verified access is in profile metadata. No SCC-4273- or Trouble Ticket-named permission set was identified in the current permission-set inventory.
Peer review requirement	Name the actual access component in the ticket and PR inventory so deployment and later audit evidence match the implementation.

Picklist and dependency evidence

Control	Observed	Current Merge evidence	Peer review reading
Service Type	7 enabled	Circuit, Internet, Voice, Video, Wireless, Other, and Locate	Pass for current Merge; no supplied acceptance matrix
Subscriber Report	72 enabled	64 unique supplied labels plus 8 additional values	Partial pass - confirm the eight extras
Subscriber Report controller	None	Not dependent on Service Type	Fail if Service Type control is required
Primary Resolution global values	61 unique	All 61 supplied labels exist globally	Pass at global-value-set level
Primary Resolution dependency	60 mappings	Controlled by Subscriber Report	Partial pass - one meaningful value is unmapped
Trouble Ticket runtime values	1 enabled	Cleared Without Repair only	Fail - record type blocks the supplied list

Value reconciliation

Check	Observed	Required reading
Supplied Subscriber Report list	70 entries; 64 unique	All 64 unique labels are present and enabled for Trouble Ticket.
Duplicate supplied reports	6 repeated labels	CUT CABLE OR DROP, CAN'T CONNECT, OUTAGE, ALL SERVICES OUT, and DAMAGE CLAIM repeat; ALL SERVICES OUT appears three times.
Additional enabled reports	8 values	All Plume Related Sub Reports; Analog Channels Out of Service; Channel Buffering; Channels Out; Fixed Wireless Trbl; GPC Declared Outage; Hosted-Features; Referred to NOC/UC.
Unmapped meaningful resolution	Fiber Splicing Completed	Present globally but absent from the 60 Primary Resolution dependency mappings.
Duplicate-format global values	3 semantic duplicates	Clear - Trip / CLEAR- TRIP; Cust Caused - No Chg / CUST CAUSED- NO CHG; Cust Caused - Trip Chg / CUST CAUSED- TRIP CHG.

Root cause The principal runtime defect is record-type value enablement: UI API evidence for Trouble Ticket returns one Primary Resolution, regardless of the broader global value set and dependency metadata.

PR and evidence boundary

Boundary	Status	Evidence and limitation
Attached source	Reviewed	The supplied SCC-4273 export and its screenshots were treated as ticket evidence, not as authorization to change Salesforce.
Merge sandbox	Verified	Organization identity, Case schema, record type, layout, three profiles, global value set, and record-type UI picklists were checked read-only.
Git pull request	Not supplied	No PR URL, base branch, head commit, changed-file list, or diff was available. Branch-to-org and branch-to-target parity cannot be approved.
Separate API org	Not connected	The screenshot comparison was not independently reproduced, so the API-side missing-field claim remains unverified in this review.
Acceptance criteria	Missing	The ticket export says None. The intended controller matrix, approved extra values, and exact deployment inventory are therefore not authoritative.
Testing and release	Not performed	No record creation, persona UI test, deployment validation, deployment, activation, access assignment, or UAT execution was performed.

Required approval gates

#	Required action	Approval evidence
1	Attach exact PR evidence	PR URL, base/head, commit SHA, changed-file list, and diff match the intended release.
2	Correct Primary Resolution enablement	All approved values are enabled for Trouble Ticket and verified through UI API plus a named-persona UI test.
3	Confirm dependency design	Product Owner states whether Subscriber Report must depend on Service Type and supplies the approved service-to-report matrix.
4	Reconcile values	Map Fiber Splicing Completed, resolve duplicate-format resolutions, and approve or remove the eight additional Subscriber Report values.
5	Correct component inventory	Ticket and PR name the record type, layout, fields, value set, dependencies, and actual profile or permission-set access components.
6	Run promotion-path validation	Re-review the PR diff, test as named personas in Merge, and independently verify the target API/UAT org after promotion.

Ready to paste peer review response

Peer review completed in GreatPlainsMerge. Changes Requested - do not approve the PR yet. The Trouble Ticket record type is active; the dedicated layout includes the source-listed Case Information, Critical Dates, and Resolution Details fields; and Admin, Standard, and System Administrator - API Only have read/edit access to all nine reviewed custom fields. All 64 unique Subscriber Report labels supplied in the ticket are enabled, with eight additional values requiring business confirmation. The blocking defect is Primary Resolution: the Trouble Ticket record type currently exposes only Cleared Without Repair even though the supplied list contains 61 unique values. Subscriber Report also has no Service Type controller, Fiber Splicing Completed is not mapped in the Primary Resolution dependency, and duplicate-format resolution values need reconciliation. The ticket has no acceptance criteria, and no PR URL, base/head, commit, file list, or diff was supplied, so branch parity and merge readiness cannot be approved. Attach the exact PR evidence, correct and retest the runtime picklists, document the intended dependency matrix and component inventory, then resubmit for peer review. No Salesforce records, metadata, activation, deployment, or access assignments were changed.

Reviewer sign-off summary

Review item	Outcome
Current recommendation	Changes Requested
Verified pass areas	Active record type; dedicated layout; source-listed fields; three reviewed profile access paths; supplied Subscriber Report labels.
Blocking areas	Primary Resolution record-type enablement; missing PR diff; undocumented dependency and value decisions.
Re-review trigger	Updated PR evidence plus successful named-persona runtime verification in Merge and the promoted target org.

This document assesses the evidence available on 5 September 2026. It does not certify deployment, target-org parity, business acceptance, or production readiness.
