

PEER REVIEW

SCC 3384 Case Trouble Ticket Peer Review

Great Plains DevA Sandbox Read only implementation assessment

Environment	GreatPlainsDevA sandbox Great Plains Communications Org 00DEa00000Fc086MAB
Review date	5 September 2026
Retrieval	Succeeded Jobs 09SEa00000jCLrhMAG, 09SEa00000jCwkfMAC, 09SEa00000jCacFMAS
Decision	Changes Requested - not ready for promotion
Boundary	No records, deployment, activation, or org metadata were changed

Decision Do not promote yet. The Trouble Ticket record type, layout, core fields, and pending-customer timing logic exist, but the runtime picklist controls, status semantics, timestamp coverage, and NOC access model do not satisfy the ticket.

Acceptance outcome

#	Scope	Result	Evidence
1	Record type and layout	Pass	Trouble_Ticket is active. The administrator profile assigns Case-Trouble Ticket, and the layout contains the requested Case Information, Critical Dates, and Resolution Details fields.
2	Status process	Fail	The reused Billing business process contains the eight requested values plus Applied, Approved, Pending, and Rejected. Complete, Canceled, and Duplicate are not closed statuses.
3	Status timestamping	Fail	The active date flow still watches legacy In-Progress and Completed values. Pending-customer entry and exit are timestamped, but the full requested progression is not captured.
4	Service and subscriber control	Fail	Subscriber Report has 72 values but no Service Type controller. Fixed Wireless exists globally but is not enabled for the Trouble Ticket record type.
5	Resolution controls	Fail	Primary Resolution has 60 dependency mappings and Secondary Resolution is multi-select, but the record type enables only Cleared Without Repair for each field.
6	NOC access	Fail	No active NOC-named profile, role, or user was found. The NOC permission set has one System Administrator assignee and omits most SCC-3384 field permissions.

Field and dependency configuration

Requirement	Configured type	Observed setup	Peer review reading
Trouble Ticket record type	Active	Case-Trouble Ticket	Pass - administrator assignment is configured
Service Type	Restricted picklist	8 global; 7 on record type	Fail - Fixed Wireless is omitted
Service Address	Compound address	Edit on layout	Pass - field and UI placement exist
Custom Priority	Restricted picklist	Low, Med, High	Pass - requested values are enabled
Subscriber Report	Picklist	72 values; no controller	Fail - not dependent on Service Type
Primary Resolution	Dependent picklist	60 mappings from Subscriber Report	Fail - record type enables one value
Secondary Resolution	Multi-select picklist	Shared 64-value set	Fail - record type enables one value
Resolution Detail	Long Text Area 32768	Edit on layout	Pass - field and UI placement exist
Critical Dates	Three custom Date fields	Created and Closed system dates included	Pass - section contains required dates
Parent Case	Standard Case lookup	Edit on layout; two validations	Pass - circular and child-type controls are active

The Primary Resolution metadata maps every Subscriber Report value to at least 16 resolutions, but four values in the shared Case Resolution set are not mapped: CLEAR- TRIP, CUST CAUSED- NO CHG, CUST CAUSED- TRIP CHG, and Fiber Splicing Completed. Several duplicate capitalization and spacing variants should be reconciled before wider enablement.

Status automation and existing data

Control	Result	Evidence
Requested status values	Partial pass	All eight values exist, but the Trouble Ticket record type reuses the Billing process and exposes four unrelated billing values.
Terminal behavior	Fail	Only Closed has IsClosed true. Complete, Canceled, and Duplicate do not set Closed Date or close the Case.
In progress and complete dates	Fail	Case Date Update based on status changes is active/latest but checks In-Progress and Completed, not In Progress and Complete.
Pending customer timing	Partial pass	The active/latest before-save Case flow stamps entry and exit. Re-entry replaces the prior start/end pair and the logic is not scoped to Trouble Ticket.
Full status progression	Fail	No timestamp fields or transition logic were found for Not Started, Assigned, On Hold GPC, Canceled, or Duplicate.

Aggregate record evidence

Metric	Observed count	Interpretation
Trouble Ticket cases	46	Existing population used only as corroborating evidence
Service Type and custom Priority	21 and 12	Core classification is only partially populated
Subscriber Report and Primary Resolution	12 and 0	No reviewed case has a Primary Resolution
Problem Occurred, Problem Reported, Repair	1, 1, and 0	Critical dates are rarely populated
Pending Customer start and end	9 and 1	Eight records have no paired end timestamp
In Progress and Completed dates	0 and 1	The active legacy-value flow does not evidence the requested transitions
Complete status	1 case; 0 Closed Dates	Complete currently behaves as an open status

Existing records may predate the current configuration, so these counts corroborate the metadata gaps but do not replace named-persona UI testing.

Access and component evidence

Access path	Result	Evidence
System Administrator profile	Pass	Trouble Ticket is visible/default, the dedicated layout is assigned, and all reviewed SCC-3384 fields are editable.
SCC 3380 NOC permission set	Fail	Case create/read/edit and Trouble Ticket visibility exist, but only Parent Case, custom Priority, and Related Outage Case field permissions are included.
Permission set assignment	Fail	One active assignee exists, but the user is a System Administrator with no role; this does not prove a least-privilege NOC persona.
Named NOC persona	Not proven	The targeted active-user query returned no NOC match by name, username, profile, or role.

Component and evidence boundary

Boundary	Evidence
Focused retrieval	Case object container, Trouble Ticket and default layouts, Case Record Page, Case Resolution value set, three Case flows, NOC permission set, and administrator profile were retrieved successfully.
Active version check	Case Before Insert Update Trigger Flow, Case After Trigger Flow, and Case Date Update based on status changes are each active/latest.
Ticket documentation gap	The ticket lists New or Updated Objects and Fields, Triggers or Automations, Components, and Permissions as None even though those components implement the story.
Workbook boundary	The linked SharePoint workbooks were not available in this session, so exact workbook-to-org matrix parity remains unverified.
Validation boundary	No check-only deployment was run because this review inspected current DevA configuration and introduced no change package.

Peer review reading The administrator path demonstrates that the components exist, but the business NOC path and runtime dependency behavior are not ready for approval.

Required approval gates

#	Required action	Owner	Evidence needed
1	Configure Subscriber Report dependency	Admin and Product Owner	Make Service Type the controller and verify the approved reports for all eight service types, including Fixed Wireless.
2	Enable resolution values	Admin and Product Owner	Enable the approved Primary and Secondary values for Trouble Ticket; remove or reconcile unmapped duplicate global values.
3	Correct status design	Architect and Product Owner	Use a Trouble Ticket-specific process or approve the shared process. Define whether Complete, Canceled, and Duplicate must close the Case.
4	Complete timestamp automation	Admin and Developer	Use exact status values, scope logic to Trouble Ticket, cover every required transition, and define repeated pending-customer intervals.
5	Establish NOC least privilege	Security Owner	Grant Case CRUD, Trouble Ticket visibility, layout access, and read/edit access to all SCC-3384 fields through a named NOC persona.
6	Correct ticket inventory	Release Manager	List the record type, business process, layout, fields, value set, flows, validation rules, permission changes, and Lightning page dependency.
7	Run named persona UAT	QA and NOC	Create a Trouble Ticket, test all dependencies, select multiple secondary resolutions, cycle statuses, repeat pending-customer hold, and verify closure behavior.
8	Review existing records	Data Owner	Decide whether the 46 existing Trouble Tickets require classification, resolution, date, or status cleanup after the configuration is corrected.

Ready to paste peer review response

Peer review completed in GreatPlainsDevA. Changes Requested. The Trouble Ticket record type is active, the dedicated layout is assigned for the administrator profile, and the requested fields and Critical Dates and Resolution Details sections are present. However, Subscriber Report is not dependent on Service Type; Fixed Wireless is not enabled on the record type; Primary and Secondary Resolution each expose only Cleared Without Repair; the active status-date flow still watches legacy In-Progress and Completed values; Complete, Canceled, and Duplicate are not closed statuses; and the NOC permission set does not provide the complete SCC-3384 field-access path to a named NOC persona. Update the component inventory, complete the eight approval gates, and rerun the workflow as a named NOC user before promotion. No records, metadata, activation, deployment, or production changes were made.
