

PR REVIEW

SCC-4487 | Add Segment to Inside Sales Order

GreatPlainsDevA | Declarative metadata pull-request assessment

Review target	SCC-4487 implementation in GreatPlainsDevA (org 00DEa00000Fc086MAB)
Review date	28 August 2026
Evidence	Focused retrieve live schema 533-order formula comparison UI and profile review
Decision	Implementation Approved PR diff parity pending
Boundary	PR review only no deployment, activation, assignment, metadata, or record changes

PR DECISION

Implementation Approved in DevA. No story-related code or metadata defect was identified. The formula, both Inside Sales placements, and effective read-only access satisfy the acceptance criteria. Because no PR URL, branch, commit, or patch was supplied, final Git PR approval is conditional on diff parity with this verified snapshot.

PR review outcome

#	Scope	Result	Reviewer evidence
1	PR branch / diff	Boundary	No PR URL, branch, commit, or patch was supplied; approve the Git PR only after confirming its diff matches DevA.
2	Order.Segment__c	Pass	Present as a Text formula: TEXT(Account.Segment__c); schema reports calculated=true, createable=false, and updateable=false.
3	Inside Sales layout	Pass	Segment__c is directly after Customer_Type__c and is explicitly Readonly.
4	Lightning record page	Pass	Record.Segment__c is directly after Customer Type, readonly, and visible only when record type name is Inside Sales.
5	Named profiles	Pass	Admin, API-only Admin, and Standard User have effective read=true/edit=false field access.
6	Formula results	Pass	All 533 sampled Inside Sales orders matched Account Segment: 158 Residential, 3 MDU Tenant, 372 blank, 0 mismatches.

Declarative design path

The DevA implementation is metadata-only: a text formula on Order mirrors the Account picklist at read time, the field is placed in both Inside Sales presentation layers, and the named profiles receive effective read-only field visibility.

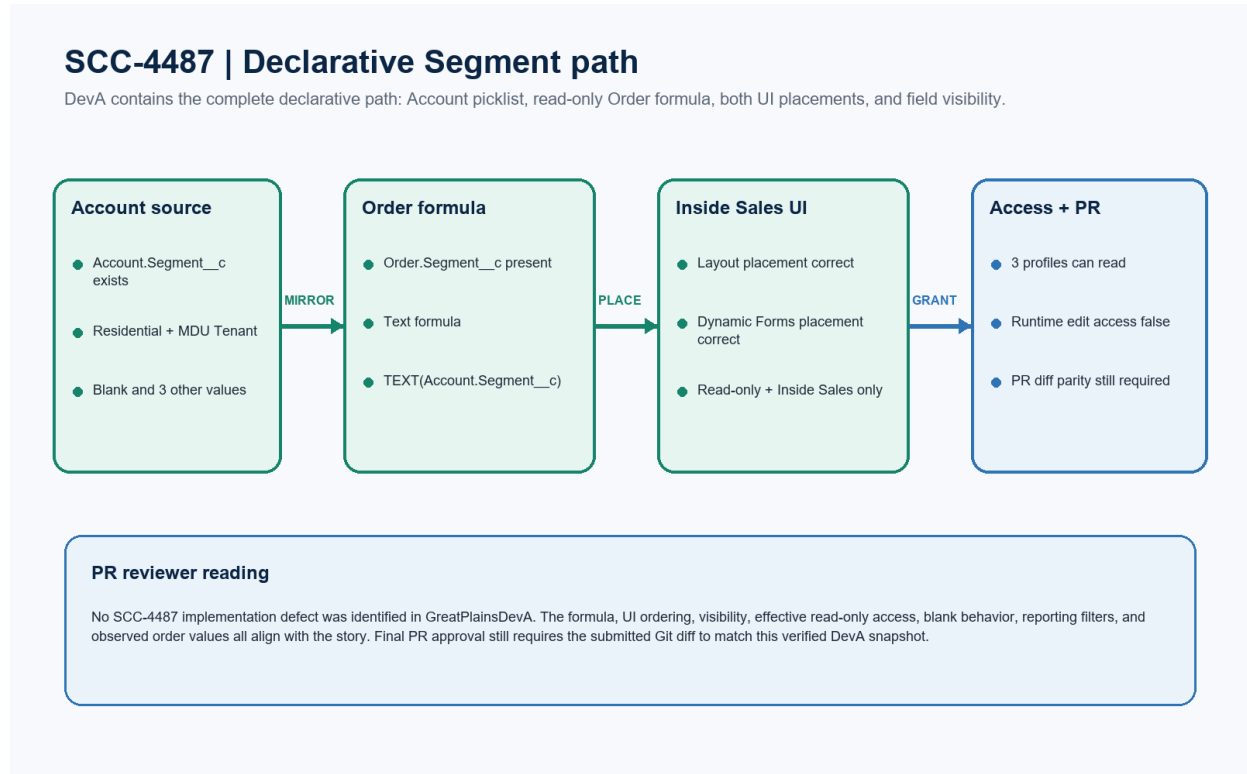

Figure 1. SCC-4487 declarative Segment path

DESIGN READING

Green components are verified in DevA. Blue marks access and the remaining PR-evidence boundary. The formula calculates at read time, so SCC-4487 does not require Apex, Flow, trigger, or persisted copy logic.

Component-by-component PR evidence

Type	Component	Observed DevA state	Reviewer evidence
CustomField	Order.Segment__c	Verified	Text formula TEXT(Account.Segment__c); label, description, and help text are story-specific.
Layout	Order-Inside Sales	Verified	Customer_Type__c -> Segment__c (Readonly) -> Additional_Information_Online_Form__c.
FlexiPage	OSE_CPQOrderRecordPage	Verified	Record.Segment__c follows Customer Type, is readonly, and has an Inside Sales visibility rule.
Profile	Admin	Verified	Field is readable; effective PermissionsEdit is false because the field is calculated.
Profile	System Administrator - API Only	Verified	Field is readable; effective PermissionsEdit is false because the field is calculated.
Profile	Standard	Verified	Field is readable and not editable; no unrelated record-type visibility change is present.

Source-field and packaging evidence

Evidence area	Observed value	Reviewer interpretation
Account.Segment__c	Picklist; editable; blank allowed	Source field exists.
Active source values	MDU Bulk; MDU Tenant; SFU; Residential; Other	Direct mirroring correctly preserves every current Account value; the ticket's two values are examples.
Order schema	Calculated; non-createable; non-updateable; nillable; filterable	Read-only, blank-safe, and usable as a report/list filter.
Observed records	533 Inside Sales orders; 0 mismatches	Includes Residential, MDU Tenant, and blank results.
Expected package	1 field + 1 layout + 1 FlexiPage + 3 profiles	Confirm the submitted PR contains these six components without unrelated churn.

EVIDENCE BOUNDARY

These findings are based on a focused read-only GreatPlainsDevA snapshot and live formula results. They validate the org implementation but cannot prove that an unsupplied Git branch or pull-request diff contains the same metadata.

PR findings and reviewer notes

Result	Area	Finding	Reviewer action
Gate	PR traceability	The actual Git diff is unavailable.	Attach the PR URL/branch/commit and compare the six metadata components with DevA.
Pass	Core field	The formula is implemented as designed.	No modification required if the PR contains the verified field metadata.
Pass	UI placement	Both presentation layers place Segment below Customer Type.	No modification required if the PR diff matches DevA.
Pass	Field access	All three named profiles have effective read-only access.	Do not add edit access or unrelated permission changes.
Note	Value semantics	Account currently has five active values.	Direct mirroring is consistent with 'same value'; no restrictive CASE mapping is needed.
Note	Change scope	The formula calculates at read time.	Keep the PR declarative; do not add Apex, Flow, trigger, or record-copy logic.
Note	Profile XML	Admin source XML may show editable=true.	The live FieldPermissions API reports edit=false and schema updateable=false; this is not a runtime defect.

Formula review standard

Review item	Required design	Reason
Return type	Text formula	The source is a picklist; Order must display its current label as read-only text.
Recommended formula	TEXT(Account.Segment__c)	Mirrors the current Account value at read time and naturally returns blank when the source is blank.
Security	Effective read=true; edit=false	Live schema and FieldPermissions confirm the formula cannot be edited.
Dependencies	Account relationship only	No trigger, Flow, scheduled process, or persisted synchronization is required.

PR APPROVAL GATE

The DevA implementation is acceptable. Approve the submitted PR after confirming its six-component diff is identical in substance, contains no unrelated churn, and retains the metadata-only design.

Reviewer approval checklist

#	Reviewer check	Approval evidence
1	PR identity	PR URL, source branch, target branch, commit SHA, and Jira key are present.
2	Package completeness	All six components are in the diff; omissions and extra dependencies are explained.
3	Formula metadata	Order.Segment__c is Text Formula with TEXT(Account.Segment__c), a clear description, and blank-safe behavior.
4	Layout order	Segment is directly after Customer_Type__c on Order-Inside Sales.
5	Dynamic Forms order	Record.Segment__c directly follows Customer Type, is readonly, and is limited to Inside Sales.
6	Profile access	Admin, API-only Admin, and Standard User retain effective read=true/edit=false access.
7	Scope discipline	No Apex, Flow, trigger, record-update logic, record-type assignment, or unrelated metadata churn is introduced.
8	Org parity	The PR metadata matches the verified DevA snapshot summarized in this review.

Ready-to-paste PR review comment

PR COMMENT

PR Review completed for SCC-4487 - Implementation Approved in GreatPlainsDevA. Order.Segment__c is a Text formula using TEXT(Account.Segment__c), is calculated and non-editable, and is filterable for reports and list views. Segment appears directly below Customer Type on both Order-Inside Sales and OSE_CPQOrderRecordPage; the Dynamic Forms field is readonly and limited to the Inside Sales record type. Admin, System Administrator - API Only, and Standard User have effective read=true/edit=false access. A read-only comparison of 533 Inside Sales orders found 158 Residential, 3 MDU Tenant, and 372 blank values with zero Account-to-Order mismatches. No SCC-4487 code change is required. Final Git PR approval is conditional on the submitted six-component diff matching this DevA snapshot and containing no unrelated metadata churn. This review made no Salesforce changes.
