

PR REVIEW

SCC-4487 | Add Segment to Inside Sales Order

Great Plains Merge | Declarative metadata pull-request assessment

Review target	SCC-4487 declared six-component metadata change set
Review date	28 August 2026
Evidence	Focused Merge retrieve schema describe layout, Dynamic Forms, and profile review
Decision	Changes Requested - PR not approvable from supplied evidence
Boundary	PR review only no org changes, deployment, activation, or runtime execution

PR DECISION

Changes Requested. The declarative approach is correct, but the review evidence does not contain the core Order formula field, either required UI placement, or any of the three profile grants. The actual PR branch or diff must be supplied before approval.

PR review outcome

#	Scope	Result	Reviewer evidence
1	PR branch / diff	Blocked	No PR URL, branch, commit, or patch was supplied; live Merge metadata is evidence, not a substitute for the PR diff.
2	Order.Segment__c	Fail	The CustomField cannot be found in the connected Merge source or schema.
3	Inside Sales layout	Fail	Customer_Type__c is followed by Additional_Information_Online_Form__c; Segment is absent.
4	Lightning record page	Fail	The Dynamic Forms page has the same ordering and no Record.Segment__c field instance.
5	Named profiles	Fail	Admin, System Administrator - API Only, and Standard contain no Order.Segment__c permission.
6	Apex / Flow / trigger	Design pass	No code or automation is required; a cross-object formula is the correct low-maintenance design.

Declarative design path

The story should remain metadata-only: a text formula on Order mirrors the Account picklist at read time, the field is placed in both Inside Sales presentation layers, and the named profiles receive read-only field visibility.

Figure 1. SCC-4487 declarative Segment path

DESIGN READING

Green is the existing Account source. Red components are absent from the connected source. Amber is the access and PR-completeness gate. Do not add Apex, Flow, or trigger logic for this requirement.

Component-by-component PR evidence

Type	Component	Observed Merge state	Required PR state
CustomField	Order.Segment__c	Missing	Add a Text formula that mirrors Account.Segment__c and preserves blank.
Layout	Order-Inside Sales	Present; not updated	Insert Segment immediately after Customer_Type__c and before Additional_Information_Online_Form__c.
FlexiPage	OSE_CPQOrderRecordPage	Present; not updated	Insert Record.Segment__c immediately after Record.Customer_Type__c with read-only behavior.
Profile	Admin	Present; grant missing	Add Order.Segment__c readable=true and editable=false.
Profile	System Administrator - API Only	Present; grant missing	Add Order.Segment__c readable=true and editable=false.
Profile	Standard	Present; grant missing	Add Order.Segment__c readable=true and editable=false.

Source-field and packaging evidence

Evidence area	Observed value	Reviewer interpretation
Account.Segment__c	Picklist; editable; blank allowed	Source field exists.
Active source values	MDU Bulk; MDU Tenant; SFU; Residential; Other	Direct mirroring exposes all five values, not only the two examples.
Inside Sales record type	Order.Inside_Sales	Named profile layout assignments already exist; do not change them unnecessarily.
Profile API names	Admin; System Administrator - API Only; Standard	Use Metadata API names, not the UI labels System Administrator / Standard User.
Expected package	1 field + 1 layout + 1 FlexiPage + 3 profiles	The PR must contain exactly the six declared story components unless a documented dependency is added.

EVIDENCE BOUNDARY

These findings are based on a focused read-only Merge snapshot and the ticket-declared component list. They do not prove what is present in an unsupplied developer branch or pull request.

PR findings and required modifications

Priority	Area	Finding	Required modification
P0	Reviewability	The actual PR diff is unavailable.	Provide PR URL/branch/commit and the complete metadata diff.
P0	Core field	Order.Segment__c is absent.	Add a Text formula using TEXT(Account.Segment__c); preserve blank and make it non-editable.
P0	UI placement	Neither presentation layer contains Segment.	Update both the layout and Dynamic Forms page directly below Customer Type.
P0	Field access	All three profile grants are absent.	Add readable=true and editable=false using Admin, API Only, and Standard API names.
P1	Value semantics	Account has five active values; the story names two.	Confirm direct mirror for MDU Bulk, SFU, and Other; otherwise document an explicit formula mapping.
P1	Change scope	A formula field needs no automation.	Reject any Apex, Flow, trigger, or record-update logic added only to copy Segment.
P2	Existing assignments	Inside Sales layout assignments already exist.	Avoid unrelated record-type visibility or layout-assignment churn in the PR.

Formula review standard

Review item	Required design	Reason
Return type	Text formula	The source is a picklist; Order must display its current label as read-only text.
Recommended formula	TEXT(Account.Segment__c)	Mirrors the current Account value at read time and naturally returns blank when the source is blank.
Security	Readable=true; editable=false	Formula fields must never receive editable access in the named profiles.
Dependencies	Account relationship only	No trigger, Flow, scheduled process, or persisted synchronization is required.

PR APPROVAL GATE

Do not approve until the complete six-component diff is visible and every P0 finding is resolved. Keep the change metadata-only and remove unrelated package churn.

PR approval checklist

#	Reviewer check	Approval evidence
1	PR identity	PR URL, source branch, target branch, commit SHA, and Jira key are present.
2	Package completeness	All six components are in the diff; omissions and extra dependencies are explained.
3	Formula metadata	Order.Segment__c is Text Formula with TEXT(Account.Segment__c), a clear description, and blank-safe behavior.
4	Layout order	Segment is directly after Customer_Type__c on Order-Inside Sales.
5	Dynamic Forms order	Record.Segment__c is directly after Record.Customer_Type__c on OSE_CPQOrderRecordPage.
6	Profile access	Admin, System Administrator - API Only, and Standard grant read only; no editable=true entry exists.
7	Scope discipline	No Apex, Flow, trigger, record-update logic, record-type assignment, or unrelated metadata churn was introduced.
8	Value decision	Product owner confirms whether MDU Bulk, SFU, and Other should mirror or be intentionally mapped.

Ready-to-paste PR review comment

PR COMMENT

PR Review completed for SCC-4487 - Changes Requested. The connected GreatPlainsMerge source does not contain Order.Segment__c. Order-Inside Sales and OSE_CPQOrderRecordPage both place Additional Information immediately after Customer Type, and Admin, System Administrator - API Only, and Standard contain no Order.Segment__c field permission. Please provide the actual PR URL/branch/commit and update the complete six-component change set: add Order.Segment__c as a Text formula using TEXT(Account.Segment__c), place it directly below Customer Type in both presentation components, and grant readable=true/editable=false in all three profiles. Confirm whether the other active Account Segment values (MDU Bulk, SFU, and Other) should mirror as well. No Apex, Flow, trigger, or record-copy automation is required for this story, and unrelated layout-assignment or record-type changes should be removed from the PR. This review made no Salesforce changes.
